Table 6	2015 Trade Pound Estimates.....	5

The Association coordinates with the City of Lakewood a sampling program on Coyote Gulch in the Bear Creek Park (Figure 1 and 2). The monitoring is done at two sampling sites: above the restoration project (Upper Coyote), and at the discharge into the reservoir (Lower Coyote). Beginning in 2013, the Association incorporated the nutrient sampling into the Association monitoring program as part of the P2 Supplemental Monitoring Program. The Association reduced the monitoring frequency to bi-monthly. Nutrient analyses are done at the Association’s contract laboratory GEI Consultants Inc. The Association collects the chemistry data for total phosphorus, total nitrogen, ammonia-nitrogen and nitrate-nitrogen (Table 1). The Association takes bi- monthly flow measurements to determine nutrient loading. The Association also collects data for temperature, pH, specific conductance and Dissolved Oxygen.

Data results are incorporated into the Association annual data summaries (Tables 2, 3, and 4). The Association has pre-construction and post-construction loading data. This monitoring project has established a total phosphorus trade credit for use of the Association membership. Data maintained in the BCWA *MSD11 Coyote Gulch Data Master spreadsheet*.

Figure 1 **Flooded Coyote Gulch**

Figure 2 Coyote Gulch Project and Sample Sites

In September 2013 and May to August 2015, the reservoir became a major flood control structure. The normal pool of about 2,000 ac-ft rose to over 12,000 ac-ft for both periods. In 2013, the flooding only lasted about 30-days, while the 2015 flood event lasted over 90-days. The Coyote Gulch project was completed submerged during both events.

Table 1 Nutrient Data Results

Segment	Site	Location	Date	Total Nitrogen	Nitrogen, ammonia	Nitrate Nitrite	Phosphorus, total
Segment 4a	Site 47a	Upper Coyote	2/17/2015	1677	43	1108	24
			4/20/2015	2005	20	1487	67
